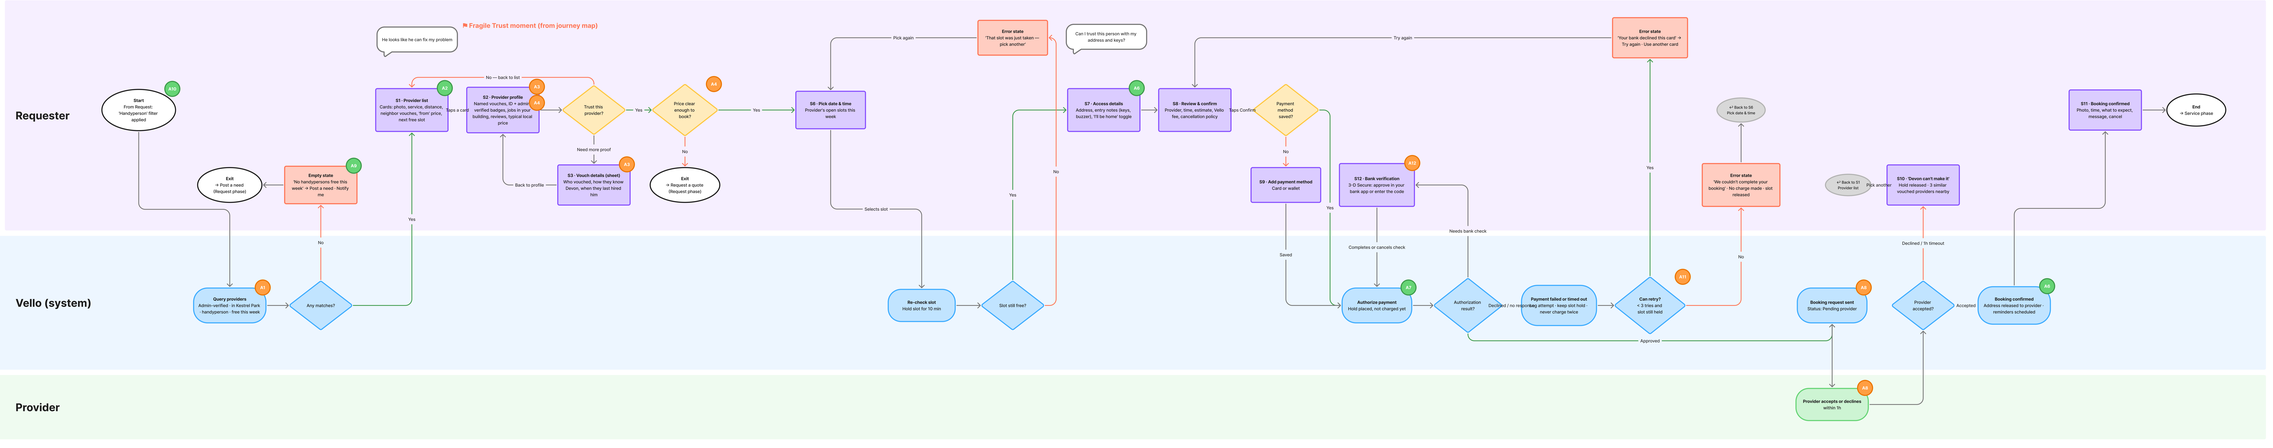
Match phase — User flow

Zoom-in on 'Match' from the User's Journey Map: a requester goes from a filtered provider list to a confirmed booking. Every screen, decision and system state; assumptions marked A1–A12.

Screen · User decision · System state · System decision · Provider action · Error / empty state · Start / end · Assumption to validate · Confirmed / clarified



Assumptions (5 confirmed · 6 to validate · 1 out of scope)

- **A1** Only admin-verified providers inside the pilot neighborhood are listed.
  Brief: verification gate before a provider is visible
- **A2** Cards lead with neighbor vouches, not star ratings.
  ✓ Confirmed · research: trust passes through a person's word
- **A3** Vouchers agree to be named to other residents.
  Unvalidated · privacy risk in a small community
- **A4** Handyperson work is quoted per job; profiles show a "from" price and a typical local range.
  Unvalidated · journey map: "$70? That is expensive"
- **A5** Providers answer quote requests within 2 hours.
  Out of scope · belongs to the Request phase flow
- **A11** Requesters get up to 3 payment attempts while the 10-minute slot hold is active.
  Unvalidated · balance recovery vs. holding the provider's slot
- **A12** Exact address and entry notes are released only after the booking is confirmed.
  ✓ Confirmed · journey map: "Can I trust this person with my address and keys?"
- **A7** Payment is authorized at booking and captured after the service.
  ✓ Confirmed · still needs a payments / legal check on implementation
- **A8** v1 is request-to-book (provider accepts), not instant book.
  Trade-off: provider-control vs. speed
- **A9** With no matches, Vello routes to "Post a need" rather than widening the boundary.
  ✓ Confirmed · research: the neighborhood boundary is contested
- **A10** The requester may or may not already know the provider. The flow must work in both cases.
  ✓ Clarified · no personal link is possible but not required; design for it as the worst case for trust
- **A11** Banks may require 3-D Secure; Vello handles it in-app without losing the slot.
  Needs payments-provider check
